```
re domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4
(L4)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4
(Mere P1, P2, P3, and P4 = are each independently sequences of
pharmacologically active peptides; L1, L2, L3, and L4 = are each
independently linkers; and a, b, c, d, e, and f = are each independently
(C or I, provided that at least 1 of a and b is 1. The composition can
have cytostatic, antiasthmatic, thrombolytic and immunosuppressive
activities. DNAs, vectors and host cells from the present invention can
useful for treating cancer, asthma, thromboslis, or autoimmune diseases.
The use of an Fc domain (rather than a Fab domain) can provide a longer
half-life or incorporate functions such as Fc receptor binding, protein
the life or incorporate functions such as Fc receptor binding, complement fixation, and possibly placental transfer. AAA69443
to AAA69526 and AAB16955 to AAB18003 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                       comprising an Where (I) is:
                                                                                                                                                    The present invention describes composition of matter (I) comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

(I) can have antiinflammatory, antitumour, immunosuppressive, cytostatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological, antianaemic, anorectic, antiinfertility, haemostatic, dermatological and neuroprotective activities. (I) can be used as a therapeutic or
                                The present sequence represents a synthetic peptide which is capable of inhibiting the blological activity of anti-beta-2-glycoprotein I (B2GPI) monoclonal antibodies in vitro and of inhibiting in vivo induction of experimental anti-phospholipid syndrome in mice by anti-B2GPI monoclonal antibodies. The peptides are used for diagnosis and treatment of anti-phospholipid syndrome. They may also be used for the diagnosis of anti-phospholipid antibodies with different pathogenic blofunctions which may correlate with different complications, thrombosis or coagulation dysregulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a vehicle-peptide molecule (I) or its

prophylactic agent as well as for screening purposes. (I) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of interest, as a part of diagnosing kit to detect the presence of their proteins of interest in a biological sample. Additionally, (I) is useful for treating inflammatory and autoimmune diseases, tumour growth, cancer, rheumatoid arthritis, diabetic relinopathy, obesity, sleep disorders, infertility and neurological degenerative diseases. (I), comprising EPO-mimetic compounds are useful for treating disorders characterised by low red blood cell levels such as anamia. The TPO-mimetic comprising compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet cumour which result in thrombocytopaenia, spitamic lupus erythematosus, and senconi a syndemic acid and nucleic acid sequences used in the expension of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMF; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vagcular endothelial growth factor; matrix metalloproteinase;

independently selected from -(LI)c-Pl, -(LI)c-Pl-(L2)d-P2,
-(LI)c-Pl-(L2)d-P2-(L3)e-P3, or -(LI)c-Pl-(L2)d-P2-(L3)e-P3-(L4)f-P4
where Pl, P2, P3, and P4 = are each independently sequences of
pharmacologically active peptides; Li, L2, L3, and L4 = are each
independently linkers; and a, b, c, d, e, and f = are each independently
or I, provided that at least 1 of a and b is 1. The composition can
have cytostatic, antiasthmatic, thrombolytic and immunosuppressive
activities. DNAs, vectors and host cells from the present invention can
be used for producing pharmaceutical compositions. The compositions are
useful for treating cancer, asthma, thrombosis, or autoimmune diseases.
The use of an Fc domain (rather than a Fab domain) can provide a longer
the use of an Fc domain (rather than as Fc receptor blading, protein
A binding, complement fixation, and possibly placental transfer. AAA6943
to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EPO; erythropoletin; TPO; tumour necrosis factor alpha inhibitor; TNF-alpha inhibitor; Interleukin 1 antagonist; IL-1 antagonist; TMP; TPO mimetic peptide; EMP; EMP; PEO mimetic peptide; EMP; PEO mimetic pentide; EMP; PEO mimetic antilufammatory antilumour; EMP; PEO mimetic antilufammatory antilumour; Immunosuppressive; cytostatic; antilufammatory antilumour; antidabetic; ophthalmological; antiluaemic; antilufertility; haemostatic; dermatological; antiluaemic; inflammatory disease; autoimmune disease; tumour growth; cancer; rheumatorid arthritis; diabetic retinopathy; infertility; obesity; sleep disorder; neurological degenerative disease; anaemia; thrombocytopaenia; metastatic tumour; systemic lupus erythematosus;

multimers. (I) can have antiinflammatory, antitumour, immunosuppressive, cytostatic, antirheumatic antiarthritic, antidiabetic, ophthalmological, antiamemic, anorectic, antiinfertility, haemostatic, dermatological and neuroprotective activities. (I) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (I) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their proteins of interest in a blological sample. Additionally, (I) is useful for treating inflammatory and autolumnune diseases, tumour growth, cancer, infertility, and neurological degenerative diseases. (I), comprising EPO-minetic compounds are useful for treating diseases. (I), comprising compounds are useful for treating diseases. (I), comprising compounds are useful for treating diseases. (I), comprising compounds are useful for treating conditions that involve an existing magakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency and expected megakar

Novel synthetic peptides that inhibit anti-beta-2-glycoprotein lantibodies, useful for diagnosis and treatment of anti-phospholipid syndrome in humans

Claim.3; Page 37; 58pp; English.

The present sequence represents a synthetic peptide which is capable of inhibiting the biological activity of anti-beta-2-glycoprotein 1 (B2GPI) monoclonal antibodies in vitro and of inhibiting in vivo induction of experimental anti-phospholipid syndrome in mice by

```
The present invention describes composition of matter (I) comprising an Ec domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-FI-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2, (L3)e-P2, (L3)e-P2, (L3)e-P2, (L3)e-P3, or -(L1)c-P1-(L2)d-P2, (L3)e-P3-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, and f = are each independently linkers; and a, b, c, and f = are each independently linkers; and a, b, c, and f = are each independently linkers; and ma, b, c, and f = are each independently linkers; and ma, b, c, and f = are each independently linkers; and a, b, c, and f = are each independently linkers; and a, b, c, and f = are each independently linkers; and a, b, c, and f = are each independently linkers; and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

The use of an Fc domain (rather than a Fab domain) can provide a longer by 1.16.
                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        half-life or incorporate functions such as Fc receptor binding, protein
anti-B2GPI monoclonal antibodies. The peptides are used for diagnosis
                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autofimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MAP; inhibitor; erythropoletin; thrombopoletin; interleukin 1; cytocoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthms; thrombosis; pharmaceutical.
                    and treatment of anti-phospholipid syndrome. They may also be used for the diagnosis of anti-phospholipid antibodies with different pathogenic blofunctions which may correlate with either pregnancy complications, thrombosis or coagulation dysregulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               worst composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases .

A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a vehicle-peptide molecule (I) or its multimers. (I) can have antiinflammatory, antitumour, immunosuppressive, cytostatic, antinheumatic, antidiabetic, ophthalmological, antidanemic, anorectic, antidarthritty, heamostatic, ophthalmological, antidanemic, anorectic, antidartility, heamostatic, dermatcological and neuroprotective activities. (I) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (I) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of proteins of interest, as a part of diagnostic kit to detect the presence of their proteins of interest in a biological sample. Additionally, (I) is useful for treating inflammatory and autoimmune diseases, tumour growth, cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders, infertility, and neurological degenerative diseases. EPO-mimetic compounds are useful for treating disorders characterised by low red blood cell levels such as anaemia. The TPO-mimetic comprising compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet tumour which result in thrombocytopaenia, systemic lupus erythematosus, and Fanconi's syndrome. ABB72403 to ABB73405 and ABL35695 to ABL35777 represent amino acid and nucleic acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a synthetic peptide which is capable of inhibiting the biological activity of anti-beta-2-glycoprotein 1 (82GFT) monoclonal antibodies in vitro and of inhibiting in vivo induction of experimental anti-phospholipid syndrome in mice by anti-B2GPI monoclonal antibodies. The peptides are used for diagnosis and treatment of anti-phospholipid syndrome. They may also be used for the diagnosis of anti-phospholipid antibodies with different
                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel synthetic peptides that inhibit anti-beta-2-glycoprotein 1 antibodies, useful for diagnosis and treatment of anti-phospholipid syndrome in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pathogenic biofunctions which may correlate with either pregnancy complications, thrombosis or coagulation dysregulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monopeptide which inhibits anti-beta-2-glycoprotein 1 antibodies
                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-beta-2-glycoprotein 1 antibody; anti-B2GPI antibody; anti-phospholipid syndrome; anti-phospholipid antibody; pregnancy complication; thrombosis; coagulation dysregulation.

The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disporters associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing in a patient's genome that affect the activity of P by expressing by inscribug the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal cancer used in the prevention, diagnosis and AAB77789 represent sequences used in the exemplification of the

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor.

The polypeptide is useful as an immunogenic composition for eliciting mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is useful for treating cancer. The polypeptide is also useful for treating cancer. The polypeptide is processed class I or class II MHC-binding polypeptide. The polypeptides on particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarchoma, sarcoma, melanoma, Imphoma or leukaemia These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expension tag (EPT) isolated from human tissue for translational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          17-NOV-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -SEP-2000
```

```
The invention relates to novel nucleic acids and polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to these polypeptides. The polynucleotides are especially useful in the diagnosis, prognosis, prevention and/or treatment of diseases which include kidney disorders (e.g. renal failure or nephritis), cardiovascular disorders (e.g. hypertension or myocardial infarction), electrolyte imbalance disorders (e.g. hyponatraemia or hyperkalaemia), neoplastic disorders (e.g. nephtoma or renal cell cancer), autoimmune disorders, endocrine disorders, diseases, cancers, inflammatory diseases, reproductive system disorders, wound healing and respiratory disorders. ANUB644-AAUB715 represent the novel human renal and cardiovascular-associated amino acid sequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotides and polypeptides, useful for diagnosing, treating, preventing or prognosing e.g. kidney, cardiovascular, blood, electrolyte imbalance or neoplastic disorders, autoimmune diseases,

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or amedicate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They can also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked include autoimmune diseases e.g. rheumatoid arthitis.

The considerative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebral ar disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebral ard fundiogenesis, nervous system disorders e.g. and ocular disorders e.g. cardiac arrest, cerebral ardisorders e.g. cardiac for an also contact infections caused by bacteria, viruses and fundidisorders listed in the appecification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin ading due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to reservative to increase or decrease storage arranding can also 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polypeptides and polynucleotides useful as diagnostic reagents the diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, for treating blood clotting disorder, heamophilia

```
The invention relates to novel isolated nucleic acid molecules (1) and concoding human secreted proteins (11). (1) and (11) are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, casts, dogs, chickens or sheep. (1) and (11) may be used in the prevention, treatment and diagnosis of diseases associated with the prevention, treatment and diagnosis of diseases associated with sequences may also be used as DNB probes in diagnostic assays (e.g. or polymerase chain reactions (PRR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and so which patients may be in need of restorative therapy. (11) may also be used as antigens in the production of antibodies and in assays to identify modulators of the production of antibodies and in assays to identify modulators and antagonists of the expression and activity of (11). The anti-(11) antibodies and introductions of antibodies and introductions of antibodies and introductions of antibodies and antagonists may also be used to prove the proteins. The anti-(11) antibodies and antagonists may also be used to converse and activity of (11). The anti-(11) antibodies may also be used as diagnostic agents for detecting the presence of (11) in samples (e.g. py enzyme linked immunosorbant assay (EISA)). The intrict of disorders include for example: linked immunosorbant assay (EISA). The anti-(11) antibodies and multiphase selectorsis), cancers and hyperprofilerative disorders (e.g. nelanomas, neoplasms of the breast or liver, Sezary syndrome and Gaucher's disease and Charcot-Marie-Tooth disease), cardio-/
cerebrovascular disorders (e.g. cardiac arrest, tachycardia, and multiphase and charcot-Marie-Tooth disease), cardio-/
angina and thrombosis), infections caused by bacteria, viruses and capting, and trombosis), infections caused by bacteria, virused protein amino acid sequences, and related sequences of the invention.
